

Evaluation - final project (Unit 11)

In Unit 11, we need to develop the software based on the requirement we collected from our customers. We were excited about this project as we will finally move forward with our progress to the code development.

While the project was progressing, we concluded more and more specifications and pending tasks. We also came across more challenges:

Our original plan needed to be adjusted to fit the reality

As when we made our original plan, we did not have the full information in hand to make a highly accurate estimation of the plan. We understood that it is normal that the plan will keep being modified during the process, therefore, we implement a weekly sprint along with the sprint-review meeting by the end of each sprint, which allows us to review and update our plan on a regular basis.

Our customer is not responding at all during the development phase

The truth that our customer ignores our message (from email, chat box, Slack, etc.) is disrespectful and affects our motivation for development at a certain point. We are grateful that we have a good team that supports each other and discusses together a solution.

We understood that this is a chance to learn how to deal with tough customers like this who do not communicate, so we decided to keep progressing on our development on our own. Each of our team members took the responsibility to review the features of the software to ensure we provide the best product to our customers.

We were facing the problem that the tasks were overloaded

After starting our software development process, we found some issues and problems from our print review meeting. It means more tasks need to be added to our plan. With limited resources and time, it made us hard to keep our plan on track. We overcame this challenge by reprioritizing our backlog and removing some less important tasks to ensure we progress to our main goal.

This is my first time participating in the full cycle of the software development project. Even though it was stressful at the beginning, I believe all those challenges I faced became precious experiences for my learning. I appreciate all the effort from my team as well, I enjoy our collaboration and feel supported through our teamwork. I found this assignment help for my software project management learning.
